[Keyword Search Tips](#)

Over 30+ years in my automotive career I have used pattern failure diagnosis to save countless hours of time. I apply what I have seen and learned from previous vehicles and publications to give me an advantage in diagnosing vehicles that come into my service bays or to help my parts customers. CARQUEST Direct-Hit has taken this approach to the next level in that I can not only use my experience but also thousands of other peoples' experiences to determine the most common failures of a particular system or vehicle. This lets me work like I have a high level of experience on a vehicle or problem even though I may not have seen it before. Overall it helps me show a higher level of professionalism and expertise to the customer. It is one of the most valuable tools a technician can have in their toolbox.

THE TEST AND CONFIRMED FIX

2000 Honda Odyssey LX 3.5L

Hotline Archive Summary

Printer Friendly Confirmed Fix

Vehicle Description: 2000 Honda Odyssey LX 3.5L

Mileage: 120000

Customer Concern: The dash lights are inoperative. Also the passenger power window and both rear vent windows are inoperative. The passenger window will work with the switch on the passenger door. Since the driver multiplex talks to the passenger multiplex, test the dash light first.

Tests/Procedures:

1. Check the fuses and verify there is voltage to the dash lights on the Red/Black (Red/BLK) wire.
2. The Red wire is the ground side of the dash light circuit and is controlled by the driver's side multiplex control unit. Locate the driver's side multiplex control unit on the driver's fuse box. Locate the Red wire and ground it and verify the dash lights will work.
3. If the dash lights work, verify the rheostat input to the multiplex control unit and powers and grounds to the multiplex control unit. If that is OK, the multiplex control unit is faulty.

Potential Causes: Multiplex control unit

Tech Tips: Honda has a recall for the multiplex control unit. 00-071

Diagnostic Codes: None
